

Powering the **NET** 
January 13, 2000
Washington, DC
CSIS Internet Policy Project

As part of the CSIS Internet Policy Project, the Energy and National Security Program and the International Communications Program are pleased to host this public forum on the implications of expanding electronic commerce for electricity supply and reliability. In the coming decade, will the electricity generation and distribution industries be able to supply reliable power sufficient to support the increasing use of the Internet for commerce and trade? Join us for thought-provoking presentations on potential demand, possible generation and distribution inadequacies, reliability requirements, and new technologies in each of these critical policy areas.

Powering the Net
